Hiring Team — <COMPANY>

Application for Senior Full Stack / DevOps Engineer

Dear Hiring Team,

Introduction

Computer Science with over **5 years of professional experience**—and an even longer personal track record—building, deploying, and operating high-performance software solutions. I have led *end-to-end* projects handling **≈5 million daily transactions**, designing .NET 8 microservices, orchestrating CI/CD pipelines in Azure DevOps, and tuning SQL Server and Solr databases in high-availability environments. Outside work, I run a personal *home-lab* on a Synology NAS and Docker, where I experiment with generative AI, LLMs, and infrastructure automation using Terraform and Kubernetes.

Why <COMPANY>

<COMPANY> stands out for its innovative vision and global scale. Your commitment to software-engineering excellence, DevOps culture, and cloud adoption perfectly matches my career path. I am especially excited about contributing to <PROJECT/PRODUCT>, where my expertise in external API integrations, continuous deployment, and cloud-native monitoring can accelerate time-to-market and strengthen system resilience.

Why Me

- **Proven production impact**: cut deployment time by 30% and reduced critical incidents by 40% through automated pipelines and thorough integration testing.

- **Full-stack + DevOps mindset**: from React/SvelteKit to Kubernetes, covering .NET Core, SQL/NoSQL, and observability with Prometheus + Grafana.

- **Remote leadership**: coordinated distributed teams across Europe and LATAM, applying agile methodologies and fostering continuous communication.

- **Continuous learner**: maintain personal projects (LLMs, vector DBs) and share best practices on GitHub, demonstrating curiosity and self-driven growth.

I am confident that my technical expertise, continuous-improvement mindset, and ability to integrate into multicultural teams will deliver immediate value to <COMPANY>. I look forward to discussing how we can achieve <COMPANY>'s business goals together.

Sincerely,

Alejandro Iglesias Calvo
